ABSTRACT

**Background/purpose** – ChatGPT, a recent form of AI-based language model, have garnered interest among people from diverse backgrounds with its immersive capabilities. Using ChatGPT to support or generate scientific research has also created an ongoing debate over its advantages versus risks. The present study aimed to conduct an AI-enabled research process using ChatGPT so as to evaluate its potential to generate an accurate, clear, concise, and unbiased information as these are essential elements of rigorous scientific work.

**Materials/methods** – To achieve this aim, we worked on emergency remote teaching (ERT), which garnered significant interest due to its wide-spread use during the COVID-19 pandemic, and created opposing views, particularly in comparison to online teaching. We conducted a simultaneous query on ChatGPT-3.5 and 4 on five basic themes: (1) the definition and emergence of ERT, (2) the appropriateness of ERT for different grade levels, (3) a comparison between ERT and online teaching, (4) the possible outcomes of ERT, (5) the future prospects and uses of ERT, and we performed a comparative evaluation of these responses with regard to accuracy, clarity, conciseness, and potential bias. We also used Cohen’s kappa to assess inter-rater agreement in our analysis.

**Results** – The results indicated that both versions were capable of generating accurate information without significant bias although the responses lacked depth and insight with being somewhat repetitive. As the level of judgment required by the query increased, the performance of ChatGPT-4 was much better; it provided clearer and more concise responses with a more synthesized and detailed categories of information on ERT.

**Conclusion** – Based on our results, we state that the cooperation of human and artificial intelligence is still warranted to ensure an accurate and reliable output from AI-based scientific queries. If ChatGPT is a plane with innovative technologies, there still needs to be a pilot in the cockpit to make use of these technologies in the best way so as to fly the plane safely to its destination.

**Keywords** – Artificial intelligence, ChatGPT, emergency remote teaching, OpenAI, generative AI, AI in education, chatbot.

## 1. INTRODUCTION

Since the release of ChatGPT (Chat Generative Pre-trained Transformer) by OpenAI Limited Partnership, San Francisco, USA on November 30, 2022, it has generated a lot of excitement and enthusiasm for individuals from diverse backgrounds about experimenting this new tool, and lively discussions have been taking place in many fields (Chen 2023). ChatGPT, as a recent form of generative artificial intelligence, is actually a large language model (LLM) with impressive capabilities in producing high-quality texts on a wide range of topics, generating coherent and human-like output when answering questions or statements, and thus allowing users to communicate with computers in a more natural and conversational way (Sabzalieva and Valentini, 2023).

Given the exponential interest in the capacity and capabilities of ChatGPT, it has also created an ongoing debate over the advantages versus the risks of advanced AI technologies in the scientific community. The discussions were two-fold. On one hand, it is considered that ChatGPT could aid academics when conducting research and writing papers with its diverse functionalities such as serving as a search engine that provides direct responses to queries, enabling users to bypass the need to manually sift through sources, generating preliminary drafts of written pieces, providing a useful ground for those struggling with writer's block, acting as an interlocutor in a brainstorming session to generate a range of novel ideas, and even promoting research equity and diversity through supporting non-English speaking researchers to better express and communicate their research ideas (Dowling and Lucey 2023; Gordijn and Have 2023; van Dis 2023). From this point of view, ChatGPT has been listed among the groundbreaking tools that can save time through aiding these crucial steps in research that require extensive efforts from human intelligence, and thus freeing up time for other critical research activities (Sallem, 2023).

On the other side of the debate, scholars have raised concerns regarding potential bias in ChatGPT's training datasets, which could limit its capabilities and result in factual inaccuracies, a phenomenon called artificial hallucination. In this case, ChatGPT could be generating a mix of true and fabricated academic texts, which raises accuracy and integrity concerns (Alkaissi and McFarlane 2023; Liebrez et al. 2023; Sallam 2023). In addition to the possibility of creating inaccurate content, the risk of bias and discrimination, Borji (2023) listed several other potential issues associated with ChatGPT, including lack of transparency and reliability, cybersecurity concerns, ethical consequences, and societal implications. Similarly, due to the dearth of pertinent training data, ChatGPT is likely to produce unsatisfactory outcomes in tasks that demand logical or common-sense reasoning since it is unable to grasp the context and meaning of the text it is asked to generate (Lund and Wang 2023; Strubell et al. 2019).

Given that accuracy, clarity, coherence and bias avoidance are essential in scientific work, the accuracy and integrity of using ChatGPT for academic purposes still warrants more work since implications of ChatGPT on scientific writing is currently unknown (van Dis et al. 2023). Considering this void, the present study aims to conduct an AI-enabled research process using ChatGPT so as to evaluate its potential to generate an accurate, clear, concise, and unbiased information on a specified research topic. To achieve this aim, we preferred to work on emergency remote teaching (ERT), which has recently garnered significant interest in the scientific world due to its wide-spread use during the COVID-19 pandemic. ERT is also frequently contrasted with online teaching, and has generated opposing views in the relevant literature regarding the future prospects and uses of ERT in different stages of formal

education (Ferri et al. 2020). Thus, we consider that ERT offers a useful ground for an AI-based investigation trial that necessitates both theoretical and judgmental information.

Emergency remote teaching (ERT) is described as a temporary switch from face-to-face or blended instruction to fully remote teaching during crisis situations or emergencies with the purpose of providing a quick and reliable access to instruction rather than creating a comprehensive educational system (Hodges et al. 2020). The world has witnessed such a massive switch during the COVID-19 pandemic as the operations of almost all educational institutions around the world was suspended to avoid the health hazards of their citizens, and resorted to ERT to enable the continuity of instruction (Karakose 2021). As eloquently expressed by UNESCO (2020), education systems around the world faced an unprecedented challenge in the wake of massive school closures mandated as part of public health efforts to stop the spread of COVID-19, and as a result, education was delivered remotely through a mix of technologies in order to ensure continuity of curriculum-based study and learning for all.

Since the time it was utilized in response to the health threatening conditions of COVID-19 pandemic, ERT has garnered much debate among scholars with regard to its deficiencies as an unplanned form of instruction as well as its potential for supporting education in the case of any future crises, health threats, or natural disasters. As the lessons learned during the pandemic implied, ERT could cause serious psychological pressures and anxiety for not only students but for teachers, academics and families, necessitate alternative assessment and evaluation methods, amplify equity issues due to unequal access to technology and online tools, and also result in surveillance and data privacy concerns. Despite these hazards, scholars also contend that ERT should still be a matter of concern for educational specialists and scholars, and they should continue developing newer frameworks and assessing its potential implications for enhancing teaching/learning experience in such crises environments (Ferri et al. 2020; Hodges et al. 2020; Karakose 2021; Whittle et al. 2020).

## 2. METHODOLOGY

In the present study, we aimed to investigate how ChatGPT, as a recent AI-based innovation, responds to our search into emergency remote teaching (ERT) so as to evaluate the accuracy, clarity, and conciseness of information as well as the potential for any bias. We also wanted to conduct a comparative analysis of responses yielded by ChatGPT-3.5 and ChatGPT4 so that we can also identify any innovation brought by ChatGPT-4. With this purpose, we first conducted a comprehensive review of literature on ERT. Based on the literature on ERT (e. g., Bond et al. 2021; Hodges et al. 2020; Whittle et al. 2020), we developed a total of 23 open-ended questions to put to ChatGPT and retrieve fundamental information about ERT. We then conducted a panel meeting as the research team to discuss over this initial list of questions, and excluded questions that would potentially yield similar results. We also combined some of the questions to be able to reach more comprehensive answers. At the end of the panel discussion, all researchers agreed upon a total of 12 questions to be asked within 5 basic themes: (1) the definition and emergence of ERT, (2) the appropriateness of ERT for different grade levels, (3) a comparison between ERT and online teaching, (4) the possible outcomes of ERT, (5) the future prospects and uses of ERT.

Following this stage, we conducted a simultaneous search on ChatGPT-3.5 and ChatGPT-4 using the same set of questions in the same order. We used each question once, and did not pose any additional questions to limit our interference to this data collection process as researchers. As researchers, we first rated these responses for each basic category

independently for the four criteria mentioned earlier: (1) accuracy of information, (2) clarity of information, (3) conciseness of information, (4) the potential for bias. The scoring for each category was made using a trichotomous rating system: 1=completely inaccurate/unclear/unconcise/biased, 2=partly accurate/clear/concise/biased, 3=completely accurate/clear/concise/unbiased. The ratings were made for responses given by each version of ChatGPT. Following this stage, a focus group discussion was also held based on these same premises. Next, we conducted a focus group meeting where we compared and contrasted information provided for each basic research theme listed above, and evaluated the accuracy and breadth of information in comparison with published research on ERT as well as any indication of bias or stance on ERT as a method of teaching.

We also used Cohen's kappa to comparatively assess the accuracy, clarity, and conciseness of information, and the degree of bias. Cohen's kappa is a widely used statistic in social and medical sciences to quantitatively assess inter-rater agreement on a nominal scale, and the agreement between the raters is used as an indicator of the quality of the categories evaluated (Vieira et al. 2010; Warren 2015). Cohen's kappa, as a chance-corrected measure of inter-rater reliability, assumes two raters as alternate versions of a test, with their ratings being comparable to test scores and thus determines whether the degree of agreement between the two raters is greater than what could be expected by chance (Sun 2011). Therefore, it is commonly accepted as a robust measure of agreement compared to a straightforward computation of percentage (Ben-David 2008; Viera et al. 2010).

Cohen's kappa is calculated over the ratings of two assessors and has a value between 0 and 1. When both raters agree completely, Cohen's kappa takes the value of 1 whereas it takes a value of 0 when the level of agreement observed is the same as what would be expected by chance (Warrens 2015). Landis and Koch's (1977) benchmark guideline is often used to interpret values between 1 and 0. Accordingly, Cohen's kappa value between 0.00 and 0.20 indicates slight inter-rater agreement, between 0.21 and 0.40 fair agreement, 0.41 and 0.60 moderate agreement, 0.61 and 0.80 strong agreement, 0.81 and 1.00 almost perfect agreement. In the present study, the Cohen's kappa values were calculated over the assessments of two researchers (T.T. and T.K.), and the results were interpreted using Landis and Koch's (1977) benchmark.

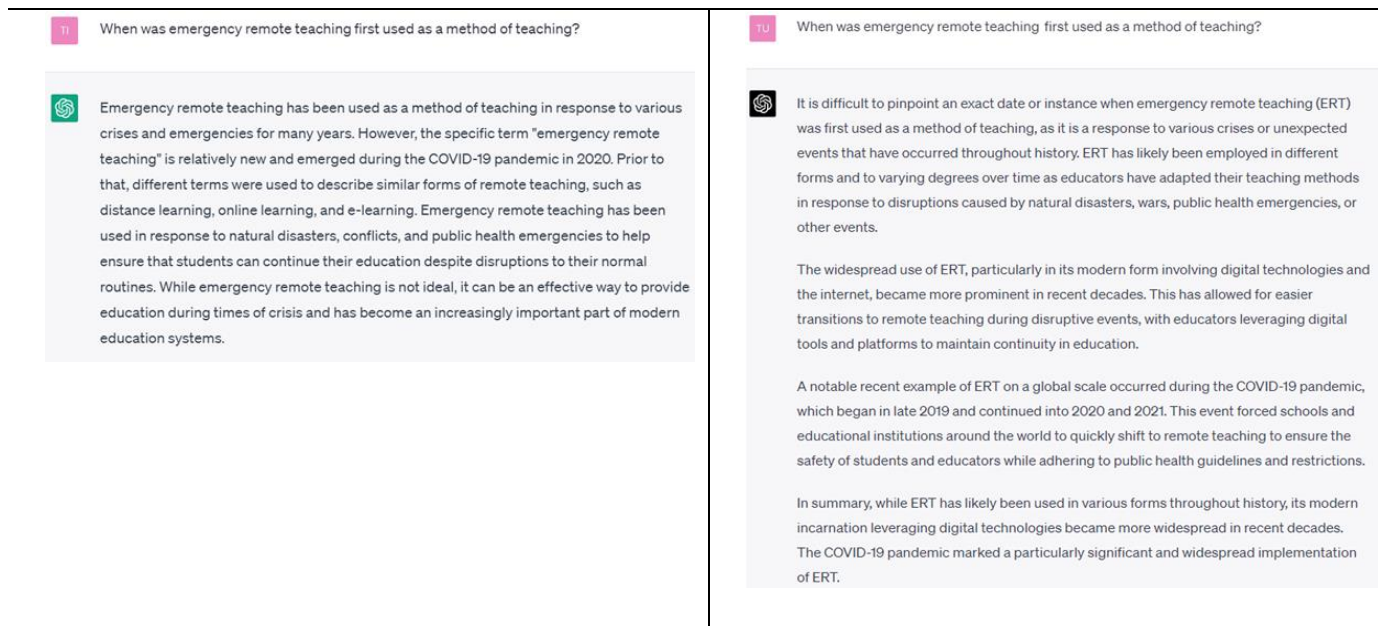

### 3. RESULTS

In this section, we present the evaluations of responses given by ChatGPT-3.5 and ChatGPT-4 to queries made in the scope of five main themes: (1) the definition and emergence of ERT, (2) the appropriateness of ERT for different grade levels, (3) a comparison between ERT and online teaching, (4) the possible outcomes of ERT, (5) the future prospects and uses of ERT. Before elaborating on the assessment of results based on our trichotomous rating system for accuracy, clarity, conciseness and the possibility of bias, we preferred to include the responses by both versions of ChatGPT in Figures to enable transparency.

Our query on ChatGPT started with the definition and emergence of ERT, and the responses were as illustrated in Figure 1.

## RESEARCH THEME: The Definition and Emergence of ERT

Model: GPT-3.5	Model: GPT-4
<p><b>TI</b> What is emergency remote teaching?</p> <p> Emergency remote teaching is a form of online teaching that is implemented in response to a crisis or emergency situation, such as the COVID-19 pandemic. It involves using technology and online tools to deliver education remotely when it is not possible for students and teachers to meet in person. Emergency remote teaching is typically characterized by a rapid transition from traditional classroom teaching to online teaching, often with limited preparation and training. This mode of teaching may involve the use of video conferencing, learning management systems, online discussion forums, and other digital tools to facilitate learning and communication between teachers and students. While emergency remote teaching is not ideal, it can provide a way for students to continue their education during a crisis or emergency situation.</p>	<p><b>TU</b> What is emergency remote teaching?</p> <p> Emergency remote teaching (ERT) is a temporary shift in teaching methods, usually due to unexpected events or crises, that require educators to switch from traditional in-person instruction to remote or online teaching. This shift is typically implemented quickly, in response to situations like natural disasters, public health emergencies, or other disruptive events that prevent regular face-to-face instruction.</p> <p>During emergency remote teaching, educators use various digital tools and platforms to deliver course content, facilitate communication, and provide feedback to students. ERT is distinct from well-planned online or distance learning, as it is often rapidly deployed without the benefit of extensive planning or preparation.</p> <p>Key characteristics of emergency remote teaching include:</p> <ol style="list-style-type: none"> <li>1. Quick transition: ERT is initiated in response to urgent circumstances, requiring educators to adapt their teaching methods on short notice.</li> <li>2. Temporary nature: ERT is typically considered a short-term solution, with the expectation that traditional in-person instruction will resume once the crisis or disruption has passed.</li> <li>3. Focus on essential content: Due to the constraints and challenges of ERT, educators often prioritize the most critical course content and learning outcomes to ensure students' progression in their studies.</li> </ol>
<p><b>TI</b> When did emergency remote teaching first start?</p> <p> Emergency remote teaching has been used in response to various crises and emergencies over the years, such as natural disasters, conflicts, and public health emergencies. However, the term "emergency remote teaching" became widely used during the COVID-19 pandemic in 2020, when schools and universities around the world were forced to close their physical campuses and transition to online learning almost overnight. This sudden shift to remote learning was necessary to protect the health and safety of students and staff, and to help prevent the spread of the virus. While remote learning has been used in various forms for years, the scale and scope of emergency remote teaching during the COVID-19 pandemic was unprecedented.</p>	<p><b>TU</b> When did emergency remote teaching first start?</p> <p> Emergency remote teaching (ERT) does not have a specific starting point, as it is a response to various crises or unexpected events that require a shift from traditional in-person instruction to remote or online teaching. Throughout history, there have been instances where educators had to adapt their teaching methods due to disruptions caused by natural disasters, wars, public health emergencies, or other events.</p> <p>However, the widespread use of ERT became more prominent with the advent of digital technologies and the internet, which allowed for more seamless transitions to remote teaching. A notable recent example of ERT on a global scale occurred during the COVID-19 pandemic, which began in late 2019 and continued into 2020 and 2021. During this period, schools and educational institutions around the world had to quickly shift to remote teaching as a means of maintaining educational continuity while adhering to public health guidelines and restrictions.</p> <p>In summary, ERT has been employed in various forms and degrees throughout history in response to crises and disruptions. The COVID-19 pandemic, however, marked a particularly significant and widespread implementation of ERT, facilitated by advancements in digital technologies and online learning platforms.</p>
<p><b>TI</b> When did emergency remote teaching emerge as a method of teaching?</p> <p> Emergency remote teaching emerged as a method of teaching in response to crises and emergencies that made it difficult or impossible for students and teachers to meet in person. For example, after Hurricane Katrina devastated New Orleans in 2005, emergency remote teaching was used to help displaced students continue their education while schools were closed or damaged. Similarly, during the Ebola outbreak in West Africa in 2014-2015, emergency remote teaching was used to provide education to students who were unable to attend school due to the risk of infection. However, it was the COVID-19 pandemic in 2020 that brought emergency remote teaching into widespread use on a global scale, as schools and universities around the world were forced to close their physical campuses and transition to online learning almost overnight. The sudden and unprecedented nature of the pandemic led to emergency remote teaching becoming a necessary and widely adopted method of teaching almost overnight.</p>	<p><b>TU</b> When did emergency remote teaching emerge as a method of teaching?</p> <p> Emergency remote teaching (ERT) emerged as a method of teaching in response to various crises or unexpected events that necessitated a shift from traditional in-person instruction to remote or online teaching. It is not a well-defined or planned teaching methodology but rather an improvised response to challenging circumstances.</p> <p>While instances of ERT have occurred throughout history, it gained prominence with the advent of digital technologies and the internet. This allowed for easier transitions to remote teaching during disruptive events, as educators could leverage digital tools and platforms to maintain continuity in education.</p> <p>The most significant and widespread implementation of ERT in recent history occurred during the COVID-19 pandemic, which began in late 2019 and continued into 2020 and 2021. In response to the pandemic, schools and educational institutions worldwide had to quickly shift to remote teaching to ensure the safety of students and educators while adhering to public health guidelines and restrictions.</p> <p>In summary, ERT emerged as an improvised teaching method in response to crises and disruptions, and it has evolved alongside the development of digital technologies and online learning platforms. The COVID-19 pandemic marked a critical point in the use of ERT on a global scale.</p>

**Figure 1.** Sample excerpts from responses of ChatGPT-3.5 & ChatGPT-4 for the definition and emergence of ERT (generated on April, 13, 2023)

The researchers rated the responses by both ChatGPT-3.5 and ChatGPT-4 based on the trichotomous rating system. The assessment of accuracy for ChatGPT-3.5 revealed a mean value of 2,8 out of 3, indicating a high level of accuracy. Similarly, the mean value for clarity and conciseness were 2,4 and 2,8 respectively. With regard to the possibility of bias, researchers classified the responses as being almost unbiased with a mean value of 2,4. The results of Cohen's kappa showed that the inter-rater agreement on the nominal scale was almost perfect, indicated with a kappa value of 0.86.

When the responses by ChatGPT-4 with regard to the definition and emergence of ERT were evaluated, the mean values of researcher's assessment were 2,8 for accuracy and clarity, 2,6 for conciseness and the possibility of bias. The kappa value of 0,91 indicated almost perfect inter-rater agreement for these responses by ChatGPT-4.

A closer scrutiny into these responses shows that ChatGPT-3.5 has a clearer focus that ERT is a form of online teaching while ChatGPT-4 tends to define it as a form of remote teaching mostly depending on the use of digital technologies. Similarly, although both versions form links between the emergence of ERT and COVID-19 outbreak, ChatGPT-4 tends to avoid forming direct relationships between ERT and COVID-19. This is particularly evident in its definition of ERT, where it makes no reference to COVID-19 while ChatGPT-3.5 does. Likewise, ChatGPT-4 gives a much thorough and comprehensive definition of ERT with a more to-the-point choice of terminology used in the educational literature. Another interesting result is that ChatGPT prefers to use an acronym for emergency remote teaching, that's ERT, although the researchers avoided using acronyms during the query, which could be interpreted as ChatGPT-4 having stronger capacity for making judgments in presenting information to the interrogator.

Our next query on ChatGPT addressed the appropriateness of ERT for different grade levels, and the responses were as illustrated in Figure 2.

## RESEARCH THEME The Appropriateness of ERT for Different Grade Levels

Model: GPT-3.5	Model: GPT-4
<p><b>T1</b> At what grade was emergency remote teaching mostly preferred?</p> <p> During the COVID-19 pandemic, emergency remote teaching was implemented at all levels of education, from preschool through higher education. However, the specific approaches to remote teaching varied depending on the age of the students and the educational level. In general, younger students, particularly those in preschool and elementary school, may have had more difficulty adjusting to emergency remote teaching due to their greater need for structure and guidance. Teachers at these levels often had to provide more hands-on support to help students navigate online learning platforms and stay engaged in their coursework. Meanwhile, students at higher levels of education, such as middle school, high school, and university, may have been more accustomed to online learning and had an easier time adapting to remote instruction. Overall, emergency remote teaching was used across all grade levels during the COVID-19 pandemic, with varying degrees of success depending on the specific circumstances and the needs of individual students and teachers.</p>	<p><b>TU</b> At what grade was emergency remote teaching mostly preferred?</p> <p> Emergency remote teaching (ERT) was not specifically preferred for any particular grade level but rather was implemented across various grade levels and educational institutions as a response to unforeseen circumstances or crises. During the COVID-19 pandemic, for instance, ERT was utilized in primary, secondary, and higher education institutions to maintain educational continuity while adhering to public health guidelines and restrictions.</p> <p>The effectiveness and preference for ERT might vary depending on the grade level, as younger students may require more hands-on guidance and supervision, which can be challenging to provide in a remote learning environment. Conversely, older students and adults in higher education or professional training programs might be better equipped to adapt to ERT due to greater familiarity with technology and more developed self-directed learning skills.</p> <p>In summary, ERT was not specifically preferred for any grade level but was implemented across different educational contexts as a response to crises or unexpected events. The effectiveness and suitability of ERT might vary depending on the age and needs of the students involved, as well as the resources and support available for remote learning.</p>
<p><b>T1</b> For what grade is emergency remote teaching the most appropriate?</p> <p> The appropriateness of emergency remote teaching depends on a variety of factors, including the age and needs of the students, the resources available to teachers and schools, and the specific circumstances surrounding the emergency situation. While emergency remote teaching can be effective in allowing students to continue their education during a crisis, it may not always be the most appropriate or effective form of instruction for all students or age groups.</p> <p>That being said, emergency remote teaching can be particularly challenging for younger students, such as those in preschool and elementary school, who may require more hands-on guidance and support from their teachers. In these cases, emergency remote teaching may need to be supplemented with other forms of support, such as educational materials and activities that can be completed offline or with the help of parents or guardians. For older students, such as those in middle school, high school, and university, emergency remote teaching may be more appropriate, as they may have more experience with technology and online learning platforms. However, it is important to consider the individual needs and circumstances of each student and to provide support and accommodations as necessary to ensure that all students have access to high-quality education during an emergency.</p>	<p><b>TU</b> For what grade is emergency remote teaching the most appropriate?</p> <p> The appropriateness of emergency remote teaching (ERT) depends on the specific situation and the resources available, rather than being inherently more suitable for a particular grade level. However, certain factors may influence the effectiveness of ERT for different age groups.</p> <p>Older students, such as those in high school or higher education, may find it easier to adapt to ERT because they typically have more developed self-directed learning skills, greater familiarity with technology, and better comprehension of complex concepts. These factors can make remote learning more manageable and effective for them.</p> <p>On the other hand, younger students in primary or elementary school might struggle more with ERT due to their need for hands-on guidance, supervision, and social interaction. Additionally, younger students might have limited access to technology or face challenges in using digital tools effectively. In these cases, ERT might be less appropriate, and alternative methods of maintaining educational continuity could be explored, such as blended learning or socially distanced in-person instruction when possible.</p> <p>In summary, the appropriateness of ERT depends on the specific context, resources, and student needs, rather than being inherently more suitable for a particular grade level. It is essential for educators and institutions to evaluate the unique needs of their students and the available resources to determine the best approach to remote learning during a crisis or unexpected event.</p>

**Figure 2.** Sample excerpts from responses of ChatGPT-3.5 & ChatGPT-4 for the appropriateness of ERT for different grade levels (generated on April, 13, 2023)

The assessment of researchers for the accuracy of responses provided by both ChatGPT-3.5 revealed a mean value of 3, indicating full accuracy. Similarly, the mean value for clarity and conciseness of responses by ChatGPT-3.5 were 2,6 while it was 2,8 for the responses by ChatGPT-4. With regard to the possibility of bias, researchers classified the responses as being almost unbiased with a mean value of 2,8. The results of Cohen's kappa showed that the inter-rater agreement on the nominal scale was almost perfect, indicated with a kappa value of 0.94.

Although ChatGPT-3.5 and ChatGPT-4 gave similar responses with regard to the appropriateness of ERT for different grade levels, ChatGPT-4 seems to offer a more synthesized version of the same information, which makes its responses more intelligible and fluent.

In the third stage of query, we asked ChatGPT about the similarities and differences between ERT and online teaching, and the responses were as illustrated in Figure 3.

RESEARCH THEME: The Comparison between ERT and Online Teaching	
Model: GPT-3.5	Model: GPT-4
<p> What are the similarities and differences between emergency remote teaching and online teaching?</p> <p> Emergency remote teaching and online teaching share some similarities, but there are also important differences between the two.</p> <p>Similarities:</p> <ul style="list-style-type: none"> <li>• Both involve the use of technology to deliver instruction to students.</li> <li>• Both require teachers to create and deliver course content in digital format.</li> <li>• Both may involve the use of online discussion forums, email, video conferencing, and other digital tools to facilitate communication between teachers and students.</li> <li>• Both may require students to complete assignments, quizzes, and exams online.</li> </ul> <p>Differences:</p> <ul style="list-style-type: none"> <li>• Emergency remote teaching is typically implemented as a temporary solution in response to a crisis or emergency situation, such as the COVID-19 pandemic. Online teaching, on the other hand, is a planned and deliberate form of teaching that is designed to provide ongoing education to students who are not able to attend classes in person.</li> <li>• Emergency remote teaching may be implemented with limited preparation and training</li> </ul>	<p> What are the similarities and differences between emergency remote teaching and online teaching?</p> <p> Emergency remote teaching (ERT) and online teaching are both methods of delivering instruction remotely, but they have different origins, goals, and implementations. Here is a comparison of their similarities and differences:</p> <p>Similarities:</p> <ol style="list-style-type: none"> <li>1. Remote instruction: Both ERT and online teaching utilize digital tools and platforms to deliver course content and facilitate communication between students and educators.</li> <li>2. Technology reliance: Both methods rely on technology, such as computers, smartphones, learning management systems, and video conferencing tools, to support teaching and learning.</li> <li>3. Flexibility: ERT and online teaching offer flexibility in terms of time and location, allowing students to learn at their own pace and access course materials from anywhere with an internet connection.</li> </ol> <p>Differences:</p> <ol style="list-style-type: none"> <li>1. Planning and design: Online teaching is typically a well-planned and carefully designed approach to education, with courses specifically created for the online format. ERT, on the other hand, is an improvised response to an unexpected event or crisis, with educators rapidly transitioning from traditional in-person instruction to remote teaching, often with limited preparation and resources.</li> <li>2. Duration: ERT is usually a temporary measure aimed at maintaining educational continuity during a disruptive event, with the expectation that in-person instruction will resume once the crisis has passed. Online teaching, however, can be a long-term</li> </ol>

**Figure 3.** Sample excerpts from responses of ChatGPT-3.5 & ChatGPT-4 for the comparison between ERT and online teaching (generated on April, 13, 2023)

Our query of similarities and differences between ERT and online teaching certainly required a more detailed analysis and synthesis, and as illustrated by the responses in Figure 3, ChatGPT-4 demonstrated a better performance in this regard. In this domain, the assessment of accuracy for ChatGPT-3.5 revealed a mean value of 2,4 while the result for clarity was 2,2 and 2 for conciseness. With regard to the possibility of bias, researchers classified the responses as being almost unbiased with a mean value of 2,4. The results of Cohen's kappa showed that the inter-rater agreement on the nominal scale was almost perfect, indicated with a kappa value of 0.89.

When the responses by ChatGPT-4 were evaluated, the mean values of researcher's assessment were 3 for accuracy, 2,8 for clarity and conciseness, and 2,6 for the possibility of bias. The kappa value of 0,92 indicated almost perfect inter-rater agreement for these responses by ChatGPT-4.

A closer scrutiny into these responses shows that ChatGPT-3.5 tends to give more general responses and often lacks details that could make the information clearer and vivid in the interrogator's mind. For instance, it mentions that ERT requires different teaching methods but lacks any examples of these methods. However, ChatGPT-4 provides more detailed information about the different pedagogies and techniques required in the practice of ERT. Similarly, ChatGPT has better capacity to categorize information and present it in a clearer and concise fashion. In addition, ChatGPT-3.5 focuses on assessment in both similarity and difference domain while ChatGPT-4 prefers to focus more on pedagogic differences, and also underlines the fact that providing technical or professional support during ERT could be

more difficult as compared to online teaching, which is not pointed by ChatGPT-3.5. These examples imply that ChatGPT-3.5 and ChatGPT-4 tend to have a different foci in this comparative analysis.

In the fourth stage, we posed questions about the positive and negative outcomes of ERT, and the responses by the two versions of ChatGPT were as illustrated in Figure 4.

RESEARCH THEME: The Outcomes of ERT	
Model: GPT-3.5	Model: GPT-4
<p><b>T1</b> What positive outcomes can emergency remote teaching provide?</p> <p> Emergency remote teaching can provide several positive outcomes in certain circumstances, including:</p> <ol style="list-style-type: none"> <li>1. Access to education: Emergency remote teaching can provide access to education for students who may not have been able to attend in-person classes due to distance, illness, or other reasons.</li> <li>2. Flexibility: Emergency remote teaching can offer more flexibility for students who need to balance schoolwork with other responsibilities, such as work or family commitments.</li> <li>3. Innovation: Emergency remote teaching can encourage teachers to experiment with new technologies and teaching methods, which can lead to innovations in education that may be beneficial even after the emergency situation has ended.</li> <li>4. Personalization: Emergency remote teaching can allow for more personalized learning experiences, as teachers can tailor course content and assignments to the needs and interests of individual students.</li> <li>5. Resilience: Emergency remote teaching can help build resilience and adaptability in both students and teachers, as they learn to navigate new challenges and overcome obstacles.</li> </ol>	<p><b>TU</b> What positive outcomes can emergency remote teaching provide?</p> <p> Despite the challenges associated with emergency remote teaching (ERT), there are positive outcomes that can emerge from this approach. Some of these include:</p> <ol style="list-style-type: none"> <li>1. Educational continuity: ERT allows learning to continue during unexpected events or crises when traditional in-person instruction is not possible, helping to minimize disruptions to students' education.</li> <li>2. Flexibility: ERT offers flexibility in terms of time and location, enabling students and educators to access course materials, collaborate, and communicate remotely. This flexibility can be helpful in accommodating individual needs and schedules during challenging circumstances.</li> <li>3. Health and safety: In situations like the COVID-19 pandemic, ERT helps protect the health and safety of students, educators, and their families by reducing the need for in-person gatherings and enabling social distancing measures.</li> <li>4. Development of digital skills: ERT exposes both students and educators to various digital tools and technologies, helping them develop valuable digital literacy and communication skills that can be useful in their academic and professional lives.</li> <li>5. Adaptability and resilience: ERT can encourage students and educators to adapt to new learning environments and develop resilience in the face of adversity. This can lead to the development of problem-solving, adaptability, and self-directed learning skills.</li> </ol>
<p><b>T1</b> What negative outcomes can emergency remote teaching result in?</p> <p> While emergency remote teaching can have some positive outcomes, it can also result in several negative outcomes, including:</p> <ol style="list-style-type: none"> <li>1. Limited interaction: Emergency remote teaching can limit interaction between students and teachers, as well as among students themselves. This can make it more difficult to build relationships, ask questions, and participate in group activities.</li> <li>2. Reduced engagement: Emergency remote teaching can lead to reduced student engagement, as students may find it more challenging to stay motivated and focused without the structure and social interaction provided by in-person classes.</li> <li>3. Technology challenges: Emergency remote teaching can be challenging for students who do not have reliable internet access, or who lack access to the devices and software needed to participate in online learning.</li> <li>4. Equity concerns: Emergency remote teaching can exacerbate existing equity concerns, as students from disadvantaged backgrounds may have less access to the resources and support needed to succeed in remote learning environments.</li> <li>5. Pedagogical limitations: Emergency remote teaching can limit the types of pedagogical</li> </ol>	<p><b>TU</b> What negative outcomes can emergency remote teaching result in?</p> <p> Emergency remote teaching (ERT) can result in several negative outcomes due to its improvised nature and the challenges associated with transitioning to remote learning during a crisis. Some of these negative outcomes include:</p> <ol style="list-style-type: none"> <li>1. Reduced quality of instruction: The rapid transition to remote teaching may lead to a decrease in the quality of instruction, as educators might struggle to adapt their teaching methods, materials, and assessments to an online format without adequate planning and resources.</li> <li>2. Inadequate technology access and support: In some cases, students and educators might not have access to the necessary technology, equipment, or reliable internet connections required for ERT. Additionally, technical support might be limited, leading to difficulties in accessing and using digital tools and platforms effectively.</li> <li>3. Reduced student engagement and motivation: Remote learning environments can be less engaging and motivating for some students, leading to a decline in participation, focus, and overall academic performance.</li> <li>4. Social isolation: ERT may contribute to feelings of social isolation among students, as it reduces opportunities for in-person interaction with peers and educators. This can have negative effects on students' mental health and overall well-being.</li> <li>5. Inequity: ERT can exacerbate existing inequities, as students from disadvantaged backgrounds might face greater challenges in accessing technology, support, and resources required for remote learning.</li> </ol>

**Figure 4.** Sample excerpts from responses of ChatGPT-3.5 & ChatGPT-4 for the outcomes of ERT (generated on April, 13, 2023)

As our query went deeper on ERT, it seemed to us that both versions of ChatGPT were likely to produce more comprehensive and detailed responses. The accuracy, clarity and conciseness of responses were categorized by researchers as being almost perfect with a mean value of 2,6 for ChatGPT-3.5, and 3 for ChatGPT-4. As our fourth query addressed the possible positive and negative outcomes of ERT, it required stronger judgment on the use of ERT. Therefore, ChatGPT-4 employed a slightly better performance than ChatGPT-4. However,

both versions attempted to avoid providing biased information, as indicated by their responses including both the positive and negative aspects of resorting to ERT as a method of teaching. The mean value of 2,8 out of 3 for the possibility of bias showed that researchers evaluated ChatGPT-4 responses for this domain as being almost unbiased. The results of Cohen's kappa also showed that the inter-rater agreement on the nominal scale was almost perfect, indicated with a kappa value of 0.91.

When the positive and negative outcomes of ERT as listed by ChatGPT-3.5 and ChatGPT-4 reviewed, it can be clearly seen that they actually say the same thing using different words or phrases. However, ChatGPT evidently generates more detailed responses including outcomes that are not mentioned by ChatGPT-3.5. For instance, for the positive outcomes of ERT, ChatGPT-4 lists improvement of health and safety, digital literacy of teachers and students and the inclusivity in education, but ChatGPT-3.5 does not. Similarly, in the negative outcomes domain, Chat GPT 4 mentions increased stress and workload of teachers in addition to other educational outcomes. On the other hand, ChatGPT continues to focus on the likelihood of decreased quality of assessment during ERT.

In the final stage of our query, we interrogated ChatGPT about the future prospects and uses of ERT, and the responses were as illustrated in Figure 5.

RESEARCH THEME: The Future Prospects and Uses of ERT	
Model: GPT-3.5	Model: GPT-4
<p> What are the future prospects of emergency remote teaching?</p> <p> The future prospects of emergency remote teaching are likely to be shaped by a number of factors, including:</p> <ol style="list-style-type: none"> <li>1. Technological advancements: As technology continues to advance, it is likely that emergency remote teaching will become more sophisticated, with new tools and platforms that offer a more seamless and interactive learning experience.</li> <li>2. Pedagogical innovations: As teachers gain more experience with emergency remote teaching, they may develop new pedagogical approaches that are better suited to online and hybrid learning environments.</li> <li>3. Student expectations: As more students become accustomed to remote and hybrid learning, they may come to expect a more flexible and personalized learning experience that integrates online and in-person instruction.</li> <li>4. Government policy: Government policy can play a key role in shaping the future of emergency remote teaching, by providing funding for technology and training, and by setting standards and guidelines for online and hybrid learning.</li> <li>5. Global events: The COVID-19 pandemic has highlighted the importance of emergency remote teaching, and it is possible that other global events, such as natural disasters or public health emergencies, could increase the demand for online and hybrid learning</li> </ol>	<p> What are the future prospects of emergency remote teaching?</p> <p> The future prospects of emergency remote teaching (ERT) will depend on several factors, including the ongoing development of technology, the prevalence of disruptive events, and the lessons learned from previous implementations of ERT. Some possible future prospects for ERT include:</p> <ol style="list-style-type: none"> <li>1. Continued use during crises: ERT will likely continue to be utilized during crises or unexpected events that disrupt traditional in-person instruction. As technology evolves and becomes more accessible, ERT could become an even more effective tool for maintaining educational continuity during such disruptions.</li> <li>2. Improved preparedness: The experience of using ERT during events like the COVID-19 pandemic has highlighted the need for better preparedness and contingency planning. Educational institutions and governments may invest more resources in preparing for potential disruptions and ensuring that educators and students have the necessary tools and support to transition to remote teaching when necessary.</li> <li>3. Integration with other teaching methods: The lessons learned from ERT can be incorporated into other teaching methods, leading to more resilient and flexible educational systems. For example, blended learning, which combines in-person and online instruction, could become more widespread, offering students and educators the benefits of both approaches and better preparing them for potential future disruptions.</li> </ol>

<p><b>TI</b> Can emergency remote teaching be used in other circumstances beyond unexpected emergencies?</p> <p> Yes, emergency remote teaching can be used in other circumstances beyond unexpected emergencies, and in fact, it is becoming increasingly common for educational institutions to offer online and hybrid learning options as part of their regular curriculum.</p> <p>For example, some schools and universities are using online and hybrid learning to provide more flexible and personalized learning experiences for students, allowing them to take classes at their own pace and on their own schedule. This can be particularly beneficial for students who have work or family commitments that make it difficult to attend in-person classes.</p> <p>In addition, online and hybrid learning can be used to reach students who may not have access to traditional educational institutions, such as those who live in rural or remote areas. This can help to address issues of educational equity and ensure that all students have access to high-quality education.</p> <p>Overall, while emergency remote teaching was initially developed as a response to unexpected crises, it has the potential to be a valuable tool for expanding access to</p>	<p><b>TU</b> Can emergency remote teaching be used in other circumstances beyond unexpected emergencies?</p> <p> Emergency remote teaching (ERT) is specifically designed to address unexpected emergencies and crises that disrupt traditional in-person instruction. However, some aspects of ERT could potentially be adapted or utilized in other circumstances, such as:</p> <ol style="list-style-type: none"> <li>1. Temporary disruptions: ERT could be employed during temporary disruptions to in-person instruction that are not necessarily emergencies, such as during building maintenance or severe weather events that make attending school temporarily unsafe.</li> <li>2. Providing access to education in remote areas: In areas with limited access to traditional educational facilities or qualified teachers, ERT could be used to deliver instruction and resources to students, helping to bridge the gap in educational access.</li> <li>3. Supporting students with health issues or disabilities: ERT can be adapted to support students who are unable to attend in-person classes due to health issues, disabilities, or other factors that make regular attendance difficult. Remote learning options can offer these students greater flexibility and access to educational resources.</li> <li>4. Supplementing in-person instruction: While not specifically ERT, elements of remote teaching can be incorporated into regular educational programs as part of a blended learning approach, combining in-person and online instruction. This can provide students and educators with additional flexibility and resources, enhancing the overall educational experience.</li> </ol>
<p><b>TI</b> What benefits can emergency remote teaching bring in the future?</p> <p> Emergency remote teaching has the potential to bring several benefits in the future, including:</p> <ol style="list-style-type: none"> <li>1. Greater access to education: Emergency remote teaching can help to increase access to education, particularly for students who may not have access to traditional educational institutions, such as those who live in rural or remote areas.</li> <li>2. More flexible and personalized learning: Emergency remote teaching can provide more flexible and personalized learning experiences, allowing students to take classes at their own pace and on their own schedule.</li> <li>3. Reduced costs: Emergency remote teaching can be more cost-effective than traditional in-person instruction, as it can eliminate the need for expensive facilities and infrastructure.</li> <li>4. Improved learning outcomes: Emergency remote teaching can provide new opportunities for collaboration and engagement, as well as access to a wider range of learning resources and tools, which can help to improve learning outcomes.</li> <li>5. Enhanced technological skills: Emergency remote teaching can help students develop technological skills that are increasingly important in today's digital age, preparing them</li> </ol>	<p><b>TU</b> What benefits can emergency remote teaching bring in the future?</p> <p> Emergency remote teaching (ERT) has demonstrated its potential to maintain educational continuity during crises and unexpected disruptions. As we look to the future, ERT could bring several benefits, such as:</p> <ol style="list-style-type: none"> <li>1. Increased preparedness: The experience of using ERT during events like the COVID-19 pandemic has highlighted the importance of being prepared for potential disruptions. Educational institutions and governments may invest more resources in developing contingency plans and ensuring that educators and students have the necessary tools and support to transition to remote teaching when necessary.</li> <li>2. Development of more resilient educational systems: ERT can inform the creation of more resilient and flexible educational systems that can better adapt to various disruptions. By integrating lessons learned from ERT into other teaching methods, educational institutions can develop strategies and approaches that can withstand future challenges.</li> <li>3. Innovation in teaching and learning: ERT has pushed educators to explore new instructional approaches, technologies, and strategies to engage students and facilitate learning. This innovation can lead to the discovery of more effective teaching practices that may continue to be valuable even after the crisis has passed.</li> <li>4. Enhanced digital tools and platforms: The increased use of ERT will drive the development of more sophisticated, user-friendly, and accessible digital tools and platforms that can support remote teaching and learning. This can help address some of the challenges and inequities associated with ERT and make remote teaching more effective and engaging.</li> </ol>

**Figure 5.** Sample excerpts from responses of ChatGPT-3.5 & ChatGPT-4 for the future prospects and uses of ERT (generated on April, 13, 2023)

With regard to the future prospects and uses of ERT, responses by the two versions of ChatGPT were quite different although they shared some common grounds as well. Although the mean values of researcher assessment for the accuracy of information was high (2,8 for ChatGPT-3.5 and 3 for ChatGPT-4), ChatGPT-4 provided more concise and thorough information. The mean values for the clarity and conciseness of ChatGPT-4 responses were 2,8 while it was 2 for ChatGPT-3.5 responses. The Cohen's kappa value of 0.86 also indicated a high level of inter-rater agreement with this regard.

Articulating responses for the possible implications of ERT in the future clearly demands more judgmental stance based on existing knowledge, and ChatGPT-4 seems to have gone way forward compared to its previous version. Although some aspects of their responses are similar, ChatGPT underlines the potential of ERT to bring some solutions to the ever-lasting problems of education such as social justice, customized teaching, resilient education systems in the face of unexpectedly and fast changing world. In fact, what makes ChatGPT-4 responses

look more convincing seems to be its capacity to offer a more comprehensive and concise categories of information.

#### 4. DISCUSSION

The current study aimed to provide an account of the responses and perspectives of the two versions of ChatGPT (3.5 and 4) with respect to emergency remote teaching, taking into account scientific accuracy, clarity, conciseness, and potential biases as the essential components of a scientific work. The present investigation sought to conduct an initial assessment of a novel technological advancement grounded in artificial intelligence, namely ChatGPT, which could potentially serve as a transformative agent for the acquisition and dissemination of knowledge in the foreseeable future.

Our descriptive assessment of the responses by ChatGPT-3.5 and 4 indicated that both versions were capable of generating accurate information without significant bias when the topic under investigation, ERT in the present case, is clearly discussed in the literature without significant controversy. However, it is also noteworthy that these responses are not only based on published research but also on a huge variety of data provided on the internet (Gilat and Cole 2023). Given that scientific knowledge grows on previous evidence and thus references to previous publications is essential, these automatic, AI based responses cannot be directly used in scientific writing as ChatGPT does not currently provide correct citing resources, and can even fabricate non-existent references (Chen 2023).

Considering a previous finding that ChatGPT performed greatly in generating queries for systematic reviews with high precision, despite cautions for the scope and transparency of analysis (Aydın and Karaaslan 2022; Wang et al. 2023), the accuracy, clarity and conciseness of information yielded by our search should not be surprising as most of the questions we put to ChatGPT could be answered after a thorough review of the literature. However, as the level of judgment required by the query increases, the performance of ChatGPT-4 seemed to be well ahead of ChatGPT-3.5's, particularly with regard to conciseness and clarity of answers. ChatGPT-4 provided a more synthesized and detailed categories of information with a larger scope of view on ERT, and with a more technical language. Yet, the responses produced by both versions still lacked depth and insight with mostly being repetitive as previously underlined (Cahan and Treutlein 2023; Gordijn and Have 2023; Liebrez et al. 2023). From this perspective, our findings also conflict with the previous assumption that ChatGPT could generate over-detailed or excessive content that would pose additional burden on the researchers (Aczel and Wagenmakers 2023; Chen 2023; Stokel-Walker and van Noorden 2023), but supports the view that using proper prompts and posing clear questions matter in carefully supervising ChatGPT to produce to-the-point responses (Sallam 2023; Wang et al. 2023).

With regard to our query on the definition and emergence of ERT, both versions of ChatGPT generated convincing responses. In a frequently cited article, Hodges et al. (2020, p. 6) defines ERT as "a temporary shift of instructional delivery to an alternate delivery mode due to crisis circumstances. It involves the use of fully remote teaching solutions for instruction or education that would otherwise be delivered face-to-face or as blended or hybrid courses and that will return to that format once the crisis or emergency has abated". ChatGPT generated very similar versions of this definition. With respect to the emergence of ERT, though, ChatGPT-3.5 gave different examples of times it was used as a method of teaching such as the Ebola outbreak in Africa during 2014-2015. Indeed, several studies were published on the use of television and radio broadcasting as a means of delivering instructions

(e.g. Darvas 2017; Hallgarten 2020; Smith 2021). Interestingly, ChatGPT-4 avoided these examples, and only mentioned COVID-19 pandemic as a typical example of a time where ERT was widely employed. This focus on COVID-19 was also evident in the responses of ChatGPT-3.5.

The differences between online teaching and ERT was another topic of hot debates in the scientific world following the COVID-19 outbreak (Barbour et al. 2020; Bozkurt and Sharma 2020; Ferri et al. 2020; Karakose 2021b). Therefore, our second query was about the similarities and differences between ERT and online teaching, where both versions of ChatGPT underlined that ERT lacked many of the essential elements of online teaching such as social contact and student interaction, carefully-prepared, high-quality digital materials, improved digital skills for both teachers and students, easy and equitable access to digital devices and digital content (Adam et al. 2017; Delen and Liew 2016). These results were really promising, particularly regarding that the answers to this query required comparisons and deeper synthesis of information.

The third step in our query on ChatGPT-3.5 and 4 were about the positive and negative outcomes of ERT. It was noteworthy that both versions approached the two questions, about the positive and the negative outcomes, from both angles. In other words, when we asked about the positive outcomes, they both mentioned that negatives outcomes should also be regarded, and vice versa. We interpreted this as an attempt to display an objective and unbiased stance during their interaction with the interlocutor. This could be assumed to be good sign of potential capability of generating more objective and accurate information in the forthcoming versions of AI-generated LLMs.

In the final set of our query, we questioned ChatGPT about the potential uses and benefits of ERT in the future. As can be expected, the first responses of both versions addressed its use in possible crises situations such as natural disasters or other health-threatening outbreaks. However, when we asked for other possible benefits of ERT without experiencing such emergencies, both versions were able to articulate judgments regarding the possible uses of ERT in solving some of the long-lasting problems of education such as acquiring equitable standards for learners with special needs, providing customized learning appropriate for the unique needs of students, and establishing a more flexible learning environment in the contemporary fast-changing context of schools. Although these responses seemed a bit over-enthusiastic in the face of existing research evidence, they provide a useful ground for developing different perspectives into the improvement of ERT experience in future instances of its use. Another point we should make is that, in this domain of our query, ChatGPT-4 generated more comprehensive and detailed responses as compared to ChatGPT-3.5. This could be due to the fact that ChatGPT-4 demonstrates better performance in areas such as reasoning, following user intent, knowledge retention and synthesis compared to earlier models such as ChatGPT-3.5 and the responses generated by ChatGPT-4 were preferred those generated by ChatGPT-3.5 over 70% of the trials (OpenAI 2023).

## 5. CONCLUSION

Since the release of ChatGPT, particularly its most recent version GPT-4, several potential use cases have been postulated or tested such as designing webpages, writing minutes, creating catalogs, writing newspaper articles, songs, poems, jokes, and scripts, providing therapy, organizing unstructured data, generating queries, creating automated applications, and answering open-ended analytical questions (Taecharungroj 2023). While the improvement in the AI technologies have already started to make many of these tasks

unexclusive, whether these developments could make some professionals redundant has become another object of curiosity (Greene 2022; Warner 2023). In fact, innovative technologies like ChatGPT will certainly have both favorable and unfavorable consequences. In the realm of science, the technology that underlies ChatGPT could fundamentally transform how people search for information by delivering immediate and in-depth results, and ChatGPT has already earned reputation as a groundbreaking tool that can serve as a research assistant, idea generator, or language editor (Sabzalieva & Valentini, 2023). Yet, as underlined by several scholars, more investigation is necessary to assess the content of ChatGPT to comprehend its potential impact on the advancement of scientific work (Checcucci et al. 2023; Gordijn and Have 2023; Sallam 2023). The results of the present study support this assumption despite showing that ChatGPT has a strong potential to aid research through generating accurate, clear, and concise information mostly free of bias. However, as cautioned earlier, ChatGPT is not governed by ethical principles and does not take the responsibility of content it produces, and as the outcomes it produces comes from the statistical analysis of billions of texts on the internet, it is still likely to reflect any cognitive bias found in this information (Sabzalieva and Valentini 2023).

The originality of the current study lies in the fact that it was one of the first studies to conduct a comparative evaluation of content produced by ChatGPT-3.5 and 4, and the results were actually very impressive. Our findings showed that the recent version of ChatGPT seems to offer better guidance for scientific queries, complying with Dowling and Lucey's (2023) expectation that ChatGPT-4 'promises a truly revolutionary language model due to advances in algorithms and over 600 times greater testing parameters' (p. 5). Yet, in its current state, the utility of ChatGPT for academic purposes seems to be limited, but we should also acknowledge that it is certainly a groundbreaking step in the development of tools to enhance scientific work (Gordijn and Have 2023). Therefore, we want to reiterate Sallam's (2023) and Kasneci et al.'s, (2023) claim that the cooperation of human and artificial intelligence is still warranted to ensure an accurate and reliable output from AI-based queries. To explain with an allegory, if we consider ChatGPT as a plane with innovative technologies, there still needs to be a pilot in the cockpit to make use of these technologies in the best way so as to fly the plane safely to its destination.

## DECLARATIONS

**Author Contributions:** Conceptualization, T.K., T.T.; methodology, T.K., T.T.; formal analysis, T.K., T.T., R.Y.; data curation, M.D., T.Y.O., R.Y.; writing—original draft preparation, T.K., T.T., H.P.; writing, review and editing, T.K., T.T.; M.D., H.P., T.Y.O., R.Y.; supervision, T.T.; All authors have read and agreed to the published version of the manuscript.

**Funding:** This research received no external funding.

**Data Availability Statement:** No identifying information was collected or included. All the data used in this research was accessed through ChatGPT-3.5 and ChatGPT 4.

**Conflicts of Interest:** The authors declare no conflict of interest.

**Acknowledgments:** The authors acknowledge the contribution of the both versions of ChatGPT, and thank to the working team of OpenAI for supporting this work through the development of this generative AI-based language model.
